

Infill top up to protect your surface, maximise performance and prolong it's lifespan.

Through **Replay's free health check**, the synthetic surface's **infill levels are measured & recommendations** are made.

**Manufacturer recommended infill** is ordered through Replay's preferred suppliers & delivered to site.

Replay technicians load the rubber or sand infill into **specialist machinery...**

...to **apply throughout** the synthetic sports surface and playing area.

The infill is then **evenly distributed using brushing** or drag mats. The surface is now ready for play.

The infill may look heavy on the surface. This is normal & will be 'bedded-in' through play & **regular maintenance.**

Any extra rubber or sand infill may be left on site for in-house maintenance teams to top up in high-use areas when required. Replay's specialist team can advise of the correct application process.

Please note: The surface may require an additional process to prepare it for the top up.
